

Today we're playing a game called the Math Language Lab!

In this game, you'll work together to think, speak, and explain like mathematicians:

We're not just finding answers we're using math language to show how we know.

Each round is a challenge: I'll show a picture, a pattern, or a problem.

Your team will **say the answer out loud** using a **full math sentence**.

The fastest team to answer correctly gets a point!

After each round, we'll mix up the teams so everyone works with new partners.

At the end, we'll see which mathematicians used the clearest math talk!

Math Language Lab

Game Rules:

- Say your answer in a complete sentence.
 *“There are __ rows of __ so __ in total.”*
- Use your team voice — loud but respectful.
- If you can, use because or so to explain.
- Points go to the fastest correct team.
- Teams change every round — everyone gets a new chance to shine.

Array Warm Up

- How many rows?
- How many in each row?"
- How many in total?"

MODEL

There are 3 rows of 4. So there are 12 in total.

Array Warm Up

-How many rows?

-How many in each row?"

-How many in total?"

There are __ rows of __.
So there are __ in total.

Array Warm Up

-How many rows?

-How many in each row?"

-How many in total?"

There are __ rows of __.
So there are __ in total.

Array Warm Up

-How many rows?

-How many in each row?"

-How many in total?"

There are __ rows of __.
So there are __ in total.

Array Warm Up

There are _____.
So there are _____.

Array to algorithm

This array represents
the equation

$$\underline{\hspace{1cm}} \times \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$$

Repeated Addition Model

$$5+5+5+5=__$$

I added $__$ four times,
so $__ \times __ = __$.

Array model

How many rows?

-There are rows.

How many apples in each row?

-There are apples in each row.

What happens if I add one more row?

-If I add one more group **then** there will be .

Equal Groups Model

How many boxes?

-There are __ boxes.

How many in each box?

-There are __ in each box.

What happens if I add one more box?

-If I add one more box then there will be __.

Area model

How many rows?

-There are __ rows.

How many in each columns?

-There are __ in each column.

This model shows `__rows` by `__columns`.

It represents the equation of $\underline{\hspace{1cm}} X \underline{\hspace{1cm}} = \underline{\hspace{1cm}}$.

[illegible]

Number Line Model

Each jump is __.

There are __ jumps.

So $_ \times _ = _$.

Comparison Language

Which vase has more?

Vase _ has **more**.

How many times as many?

Vase _ has _ times as many as vase _.

Can you explain how you know?

I know this because $_ \times _ = __$

Real-Life Comparison

Check the legos

[Student] has ____ times as many legos as [Student].

Sharing Challenge

“How many of these students will sit at each table?”

“How do you know?”

There are __ Students in total.

There are _ tables.

x=__ so each table will have _ students

Pattern Detective

What's the rule for these patterns?

If we keep going, what will happen next?

2, 4, 6, 8, ____, ____

3, 6, 9, 12, ____, ____

The rule is ____ because each time we ____.

If we keep going, then the next numbers will be ____ and ____.

Explain your thinking

Choose one question from today and tell how you solved it.

First I ____.

Then I ____.

So I know ____ because ____.

I CAN EXPLAIN

Reflection:

How confident
are you that
you can use
math language
in
multiplication?

This was...		
easy	okay	hard
